

Supplement to the knowledge of the caddisfly fauna (Trichoptera) of Slovákia

NÓGRÁDI U. Sára, UHERKOVICH Ákos
Pécs, Janus Pannónius Múzeum

ABSTRACT: During 7 collecting trips 2629 males and 1673 females of 78 Trichoptera species were collected in 37 localities. The complete list is given. Asynarchus lapponicus ZETT. proved to be new for the fauna of Czechoslovakia. Some comments on a few species are presented.

INTRODUCTION

During the years 1982-1987 seven collecting excursions were organized by us into Slovakia to obtain material from the northern part of the Carpathian Basin. These collections were very profitable. On 37 localities 4302 specimens of 78 species were collected, we believe, well contribute to the knowledge of the Slovakian caddisfly fauna. Since the number of locality data has surpassed 300, this paper can help to assess the total Trichoptera fauna of Czechoslovakia, too.

In recent years NOVÁK and OBR (1977) summarized the Czechoslovak caddisfly fauna indicating the occurrence of 211 species from Slovakia. The foundations of Slovakian fauna were laid in the first half of this century by MOCSÁRY (1900), Klapálek (1904), PONGRÁCZ (1914), FEKETE (1926), and MAYER (1935, 1936, 1937, 1938, 1939a, 1939b). The papers mentioned above give several data from the High Tatras, too. A synopsis of the caddisfly fauna of the High Tatras was compiled by RIEDEL (1962) containing data both the Slovakian and the Polish part of the mountains. This paper enumerates 130 species, of which 16 do not occur in the Slovakian part. It is regrettable that in the last decades only very little material was collected and published from this land. SEDLÁK (1963) gave data from the Lower Tatras, SÝKORA (1963) wrote about the caddisflies of Vihorlat Mountains among others. NOVÁK and OBR (1966) presented data of several rare and interesting species from certain localities of Slovakia.

THE COLLECTIONS AND RESULTS

Our collections covered the Slovakian Ore Mountains (Slovenské Rudohorie), the Lower Tatras (Nízke Tatry), Slovakian Paradise (Slovensky Raj) and the southern foothills of the West and High Tatras (Západné a Vysoké Tatry). The data derive from 37 localities as given below (see also Fig. 1). The height above sea level are also given.

SLOVAKIAN ORE MOUNTAINS

1. Dobšina. Some streams between 550 and 900 meters, a boggy meadow and spring bog at 900 m (Dankova). Rich and interesting material has been collected here by sweeping, lamp and portable light trap.
2. Gemerská Poloma. Two streams north from the village, at 620 and 900 m, respectively. Few species, but one of them has been collected here only.
3. Gočovo (450m). Slaná River south of the village. Light polluted water, only three species were collected here.
4. Hanková (380 m). Small stream, one species only.
5. Muranská Huta (700m). Almost dry bed of a small creek on limestone. Two species.
6. Muráň (440m). Stream "Muránsky Potok" one km northeast from the settlement. Two species, several specimens.
7. Roštár, 520m. Small forest creek, one species.
8. Tisovec, Čertova Dolina (620m). Narrow valley and canyon 8-10 km from the settlement. One collection with few species.

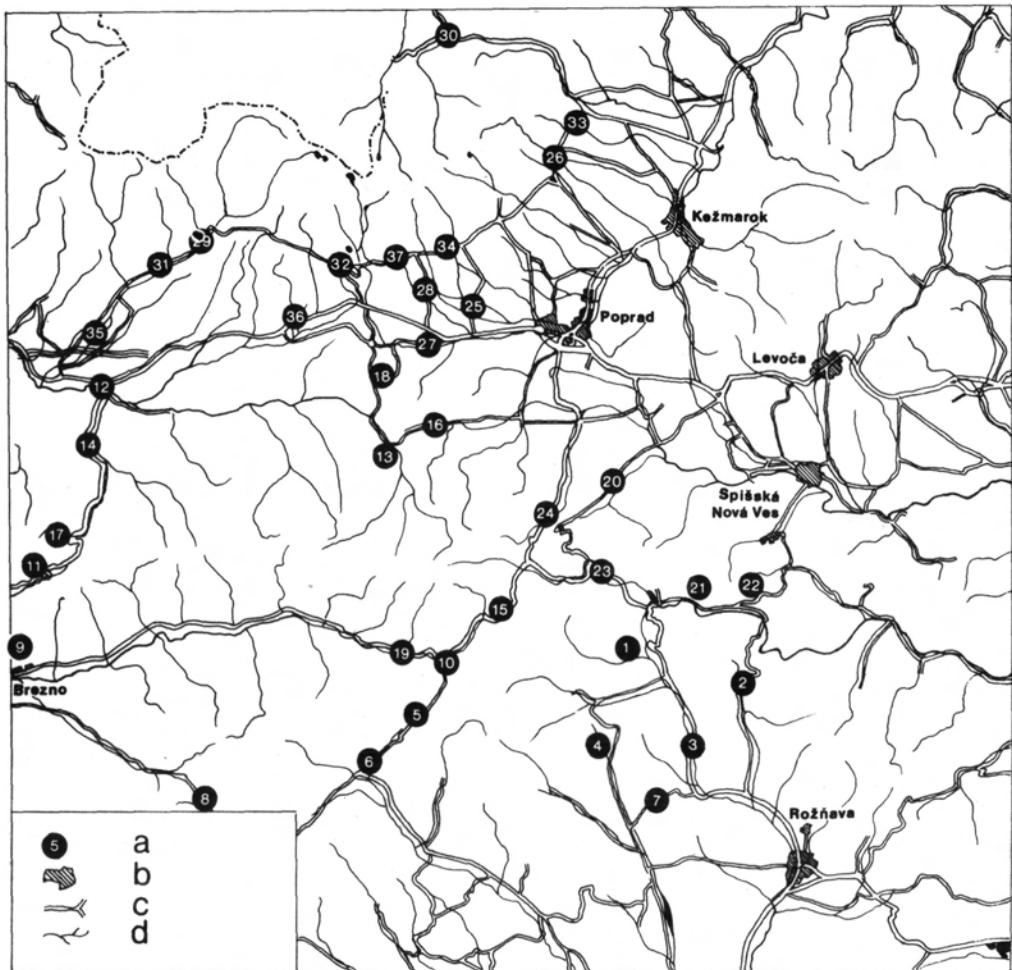

Fig. 1. Sketch map of collecting area with the sites. a = collecting sites (explanation of figures in the text), b = larger settlements, c = roads, d = streams, rivers

1. ábra. A gyűjtőterület vázlata a lelőhelyekkel. a = lelőhelyek (számok magyarázata a szövegben), b = nagyobb települések, c = patakok, folyók

THE LOWER TATRAS

9. Brezno, 650 m. Small stream under the hill "Studený vŕšok". One species.
10. Červená Skala (800-900 m). Sweeping and lamping along the Hron River and sweeping along the Župkov Stream, south from the settlement. Rich material, some species in big mass.
11. Jarabá (1000 m). Stream under the Čertovica Pass. Two species.
12. Kráľova Lehota (650 m). Váh River. Polluted water, only one species was swept.
13. Liptovská Teplička (900 m). River "Čierny Váh" and a small creek. Sweeping, only few species.

14. Malužiná (700 m). Sweeping along the Bocianka Stream, three species.
15. Šmerovo. Varied biotopes at 900-1000 m: peat bogs, spring of Hron River, small creeks, upper branches of Hnilec River. Rich material was swept here containing some rather interesting species.
16. Vikartvce (850 m). Upper braches of the river Hornád. Few species by sweeping.
17. Vyšná Boca (850 m). Upper braches of Bocianka Stream running across pasture. Only three species were swept.
18. Vyšná Šuňava (900 m). Small stream of polluted water. Only one species was swept.
19. Zlatno (750 m). Sweeping along the river Hron. Few species.

SLOVAKIAN PARADISE

20. Hrabušice (800-900 m). Small streams on limestone. (The bluk of Slovakian Paradise is of limestone.) Sweeping, several species.
21. Mlynky (700 m). Two valleys with streams. Few species were swept.
22. Rakovec (850 m). Springs in forest. One caddisfly only.
23. Stratená (800-950 m). Very varied biopotes: canyons, karst-spring, small streams, river Hnilec. Here we have collected several times, the material is rich both in species and in specimens.
24. Vernár (800-950 m). Small streams and bog (Kopanec), larger streams ("Ver-nársky potok") near the village. Some species werre swept here.

THE HIGH TATRAS

25. Batizovce (760 m). Stream "Valický potok". Collecting from the under surface of a bridge and sweeping along the stream.
26. Kežmarské Žlaby (860-920 m). Sweeping along the streams "Biela Voda" and "Čierna Voda". Some species.
27. Lučivna (780 m). Sweeping along the polluted strem "Maly Poprad".
28. Nižné Hágy (950 m). Sweeping along a forest stream. Few species.
29. Podbanské (900 m). Stream "Kamenistý potok" on granite. Sweeping several times, rich material.
30. Pospády (920 m). Stream Javorinka on sandstone. Only two species were swept.
31. Pribylina (800-850 m). Small stream on pasture near the settlement and various biotopes 4 km east from the settlement at the localtyi named Hrdovo. Some species and several specimens were swept on a peat bog, along Belá Stream and its tributary.
32. Štrbské Pleso (1100 m). Sweeping along upper branches of the stream "Biely Váh".
33. Tatranská Kotlina (800 m). River Biela, 3 species were swept.
34. Tatranská Polianka (1000 m). Sweeping several times along the stream "Velický potok" and its tributary. Some intersting species were swept.
35. Vavrišovo. Belá River and its tributary atthe camping place. Collection by daytime, some species.
36. Važek (800 m). Sweeping along the weakly polluted water of the stream "Biely Váh".
37. Vyšné Hágy (1070 m). Larger stream named "Kahule potok" running on granite. Some species were swept.

During the seven collecting trips we collected 2629 males 1673 females together. The trips were organized as follows:

1. November 1, 1982	2 species	2 ♂♂
2. September 23-26. 1984	23 species	192 ♂♂ 68 ♀♀
3. September 18-23, 1985	33 species	529 ♂♂ 1008 ♀♀
4. July 11-17, 1986	51 species	1017 ♂♂ 257 ♀♀
5. September 18, 1986	8 species	72 ♂♂ 38 ♀♀
6. May 28-30, 1987	6 species	77 ♂♂ 8 ♀♀
7. October 8-11, 1987 altogether	29 species 78 species	740 ♂♂ 294 ♀♀ 2629 ♂♂ 1673 ♀♀

The total number of collected specimens amount to 4302, which is rather large number. NOVÁK and OBR (1966) recorded 14,858 determined adults from Slovakia during the years 1955-1964. Apparently the collections were discontinued, since NOVÁK (1973) published the same figure after years.

THE COLLECTED MATERIAL

In this section all the species collected by us are presented with their localities and data. As all specimens were collected by the authors, therefore the collectors' name is not indicated. The system and nomenclature follow those of BONTOŠÁNEANU and MALICKY (1978). The total material is deposited in the collection of the Janus Pannonius Museum, Pécs, Hungary.

FAUNISTICAL REMARKS

Asynarchus lapponicus ZETT. The most important and most interesting result was the discovery of this species in Slovakia. It was indicated by BOTOSANEANU and MALICKY (1978) from the northern part of Europe and the Eastern Balkans. Is was a surprise to us when we found it at the spring of River Hron, near Švermovo (cca. 950 m a. s. l.), on September 19, 1985. According to the paper cited above it lives in stagnant waters. At the collecting spot we found only running waters, except a small concrete basin at the spring. In the environs there are peat bogs, also. It may be a glacial relict species. This species proved to be new for the fauna of Czechoslovakia.

2. ábra. Az Asynarchus lapponicus ZETT. hím ivarszerve. a = oldalnézetben, b = felülnézetben, c = hátulról, d = titillator

Synagapetus armatus McL. It lives in the Western Balkans and the Carpathians. From Slovakia it was reported by SÝKORA (1963), later by NOVÁK and OBR (1966). Only one specimen, a male was swept along a forest creek near Gemerská Poloma, at 900 m a. s. l.

Apatania carpathica SCHMID. Since its description this species was caught in few localities only. SÝKORA (1963), and NOVÁK and OBR (1966) mentioned it from Slovakia. We collected some specimens along a creek running across a boggy meadow at Došiná, Dankova.

Phacopteryx (Anabolia) brevipennis CURT. It is a relatively rare species (NOVÁK and OBR 1966). In Hungary it was collected recently (NÓGRÁDI 1984, NÓGRÁDI and UHERKOVICH 1988). Both specimens were swept along the River Hron in September. The Hungarian specimens were collected from May till July.

Chaetopteryx polonica DZIEDZ. It occurs in the Northern Carpathians and Northern Moravia (BOTOSANEANU and MALICKY 1978). SÝKORA (1963), and NOVÁK and OBR (1966) recorded its Slovakian occurrence. RIEDEL (1962) did not mention this species from the High Tatras. We collected several specimens at Tatranská Polianka among others, thus it is new for these mountains.

Pseudopsilopteryx zimmeri McL. A species of the Alps, the Carpathians and other mountains of middle heights in Central Europe. MAYER (1939a) reported it from Czechoslovakia. RIEDEL (1962) did not know it from the High Tatras. NOVÁK and OBR (1966) noted its occurrence here. We collected several specimens at 13 localities.

Annitella thuringica ULMER. Its distribution is similar to that of the preceding species. MAYER (1939a) did not record it from Slovakia. NOVÁK and OBR (1966) gave several locality data, they established that the species could be rather frequent at places. We collected several specimens. It was observed the males are swarming at bright sunshiny and windless weather, sometimes far from waters.

Further two species, Rhyacophila philopotamoides McL. and Glossosoma conformis NEBOISS were neither published by RIEDEL (1962) nor by NOVÁK and OBR (1966) from the Slovakian part of the High Tatras. We collected both species there thus, they are new for the Slovakian High Tatras.

The bulk of the material was collected by sweeping. Thus the species composition of these collecting trips cannot reflect true facts. Some Rhyacophila, Philopotamus and glossosomatid species, further some autumn limnephilids (mostly species of Chaetopterygini) proved to be conspicuously common. Limnephilus, Hydropsyche and leptocerid species were represented by only a few species in a few specimens. These latter ones can be captured mostly by lamp and light trap. The most frequent species was Allogamus auricollis PICT. In the autumn of 1985 huge masses were observed along the river Hron. In those days it was found everywhere and proved to be very frequent on the whole collecting area.

SUMMARY

During seven years seven collecting trips were led by us to Slovakia. In 37 sites 4302 specimens of 78 Trichoptera species were collected, mostly by daytime sweeping along streams, creeks, on peat bogs and boggy meadows. The collections covered the High, the Western and the Lower Tatras, the Slovakian Paradise and the Slovakian Ore Mountain. Ore species, Asynarchus lapponicus ZETT. proved to be new for the fauna of Czechoslovakia, while three for the Slovakian parts or the whole High Tatras.

Kiegészítések Szlovákiai tegzes faunájának (Trichoptera) ismeretéhez

NÓGRÁDI U. Sára és UHERKOVICH Ákos

Szerzők 1982-87 folyamán 7 gyűjtőutat tettek Szlovákiában, elsősorban abból a célból, hogy a Kárpát-medence északi részéről gyűjtsenek anyagot. Ezek az utak meglehetősen eredményesek voltak. 37 lelőhelyen 78 tegzes faj összesen 4302 példányát gyűjtötték. A lelőhelyi adatok száma meghaladja a háromszázat.

Ujabb időkben NOVÁK és OBR (1977) foglalta össze a csehszlovákiai tegzéseket. Ebben a munkában Szlovákia területéről 211 fajt említenek meg. A század első felében elsősorban MOCSÁRY (1900), Klapálek (1904), PONGRÁCZ (1914), FEKETE (1926) és MAYER (1935, 1936, 1937, 1938, 1939a, 1939b) művei alapozták meg ennek az országrésznek a faunáját. Az elmúlt évtizedekben SEDLÁK (1963) és SÝKORA (1963) munkáira támaszkodhattunk. NOVÁK és OBR (1966) számos érdekes faj adatait adják meg cikkükben. A Magas Tátra tegzes faunáját pedig RIEDEL (1962) ismertette.

Szerzők gyűjtései a Szlovák Érchegységre, az Alacsóny, Magas és Nyugati Tátrára, valamint a Szlovák Paradicsomra terjedtek ki és 37 község illetve település környékéről származnak. Elsősorban nappali hálózással gyűjtöttek, azonban alkalmanként lámpázták is (Dobšiná és Červená Skala körül). Főleg kisebb hegyi patakok, láprétek, olykor nagyobb patakok, kisebb folyók faunáját vizsgálták. Az angol nyelvű szövegen megadják az összes lelőhelyet és azoknak térképvázlatát.

Valamennyi gyűjtött példányukat közlik lelőhelyi és dátum-adatikkal együtt.

Vizsgálataik egyik legjelentősebb eredménye egy, Szlovákia és egyben Közép-Európa faunájára új faj, az Asynarchus lapponicum ZETT. megtalálása volt. Ezt a Lappföldről és a kelet-balkáni magashegyekből ismert fajt a Hrom (Garam) folyó forrásánál, 950 méters tengerszint feletti magasságban fogták. Valószínűleg jégkori reliktum.

Gyűjtések során több olyan fajt is találtak, amelyek ritkák vagy kevésbé ismertek (Synagapetus armatus McL., Apatania carpathica SCHMID, Phacopteryx brevipennis CURT., Pseudopsilopteryx zimmeri McL., Annitella thuringica ULMER) illetve a rendelkezésükre álló szakirodalom szerint eddig nem fogták azokat a Magas Tárában (Chaetopteryx polonia DZIEDZ., Rhyacophila philopotamoides McL., Glossosoma conformis NEBOISS).

Leggyakoribb fajnak az Allogamus auricollis PICT. bizonyult. Ugyancsak nágyon gyakoriak voltak bizonyos Rhyacophila, Philopotamus fajok és Glossosomatidae, ez elsősorban az alkalmazott gyűjtési mód következménye (nappali hálózás). Összel sok Chaetopterygini csopora tartozó faj sikerült gyűjteni, némelyiküket igen sok helyről, számos példányban.
