

## New species and records of Balkan Trichoptera II.

JÁNOS OLÁH & TIBOR KOVÁCS

**ABSTRACT:** Our knowledge on the Balkan Trichoptera, especially in Albania, Macedonia, and Montenegro is still very limited. Here we report 68 species collected mostly on higher elevations. Two new species are described: *Agapetus campos* Oláh sp. n., *Drusus gombos* Oláh sp. n. The unknown females of *Drusus klapaleki* and *Potamophylax juliani* have been discovered and described.

### Introduction

The Balkan Peninsula is one of the least collected regions in Europe. In addition, the collection on higher elevation is even more limited. The Sakertour Eastern Europe, Birdwatching and Hide Photography Company of the Carpathian Basin and Danube Delta has financed both spring and autumnal collecting trips in the year of 2013. We have applied the collecting, processing, clearing, cleaning, and drawing methods described by OLÁH (2011). The new method and nomenclature developed for the detailed examination and drawing of the vaginal sclerite complex of the female genitalia was described by OLÁH et al. (2013). The results of new species records as well as the descriptions of new species are presented here.

GLOSSOSOMATIDAE Wallengren, 1891

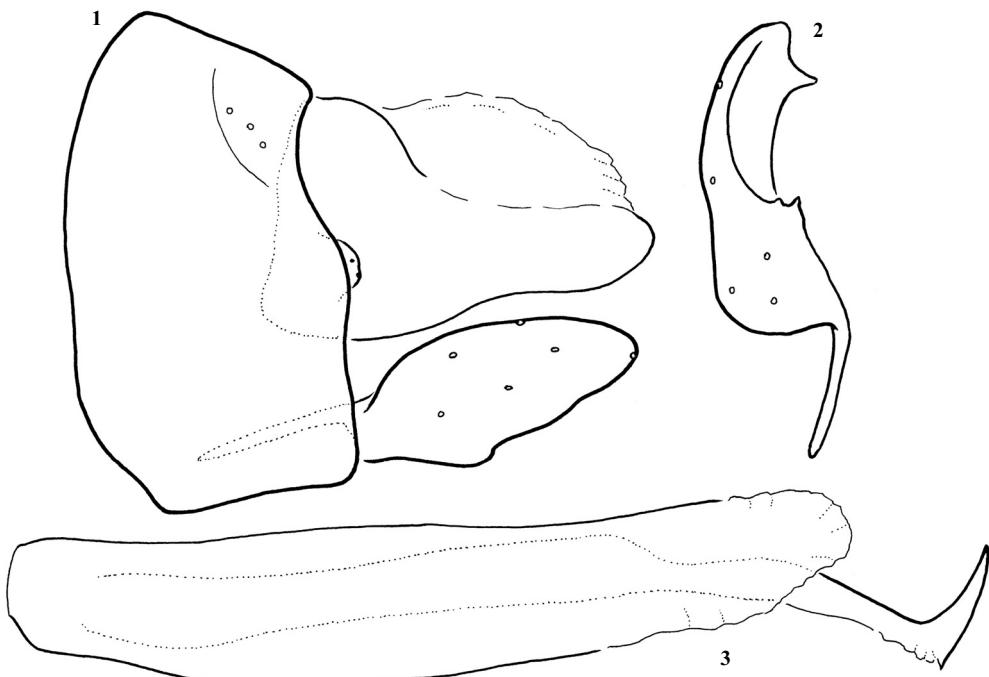

*Agapetus iridipennis* (McLachlan, 1879) – **Montenegro**, Bar municipality, Rumija Mts, Sutorman, Basa spring, N42°09'25.6", E19°06'06.3", 770 m, 26.05.2013, JP-KT-MG-PG (2♂, OPC).

***Agapetus kampos* Oláh sp. n. (Figs 1–3)**

**Diagnosis** – Its characteristic bifid hook-headed structure of the phallic organ differentiates this species from all the known European species.

**Description** – Male (in alcohol). Dark brown animal, with legs and venter slightly lighter. Maxillary palp formula: II-I-IV-V-III, second segment with globular mesolateral projection. Wing membrane brown; forewing length 4 mm; fork I on hindwing lost. Large blister-like protuberance on the dorsal margin of sternite V present; ventral process on sternite VI long.

Male genitalia. Segment IX synsclerotized with convex anterior and posterior margin in lateral view. Segment X partially pigmented, short and high; its sclerotized part deeply excised in dorsal view and deeply retracted anterad into the annular segment IX. Cerci hidden into retracted lateral cavity. Paraproctal lateral vertical plates (lateral lobe of segment X) indistinct. Gonopods in lateral view short ovoid; armed with subapical pointed black, mesad directed tooth and two small teeth mesad on the basal lobe. Phallic organ composed of long phallotheca, of

**Figs 1–3.** *Agapetus kampos* Oláh sp. n. male holotype:

1 = genitalia in lateral view; 2 = gonopod with basal plate in ventral view, 3 = phallic organ in left lateral view

a single sclerotized long structure with a pair of hooked terminal spines and of the embedding and protruding membranous matrix.

*Type material* – Holotype. **Montenegro**, Bar municipality, Rumija Mts, Sutorman, Basa spring, N42°09'25.6", E19°06'06.3", 770 m, 26.05.2013, JP-KT-MG-PG (1♂, OPC). Allotype. Same as holotype (1♀, OPC). Paratype. Same as holotype (1♂, OPC).

*Etymology* – *kampos* from “*kampós*” (= hooked) in Hungarian, referring to the hooked head of the phallic organ.

*Note* – the single female was damaged during the clearing and cleaning process, apodemes and the spermathecal sclerite complex detached, insufficient for description.

#### LEPIDOSTOMATIDAE Ulmer, 1903

**Lepidostoma doehleri** (Malicky, 1976) – **Albania**, Korçë district, Opari area, Moglicë, torrent in bushy flysh vegetation E of the village, N40°42.387', E20°25.067', 500 m, 16.10.2013, JP-KT-MD-PG (3♂, OPC).

**Lepidostoma hirtum** (Fabricius, 1775) – **Albania**, Bulqizë district, Çermenikë Mts, brooks in open forest beneath Mt. Kaptinë, N41°23.199', E20°17.338', 1600 m, 27.05.2013, JP-KT-MG-PG (1♂, OPC).

**Drusus discolor** Rambur, 1842 – **Albania**, Skrapar district, Ostrovicë Mts, Backë, brook and spring NE of the village, N40°31.346', E20°25.096', 1650 m, 29.05.2013, JP-KT-MG-PG (4♂, 11♀, OPC). **Bulgaria**, Blagoevgrad province, Belasica Mts, Petrič, spring of Lesniska Stream SW of the city, 1025 m, N41°21.021', E23°10.767', 27.10.2013, KJ-MD-SzT (1♀, HNHM).

#### **Drusus gombos** Oláh sp. n. (Figs 4–12)

*Diagnosis* – This castanean brown species belongs to the species complex with large upward arching triangular gonopods inhabiting the Balkan Mountains. Most close to *Drusus klapaleki* Marinković-Gospodnetić, 1970, but differs by having cerci less slender with more bulky

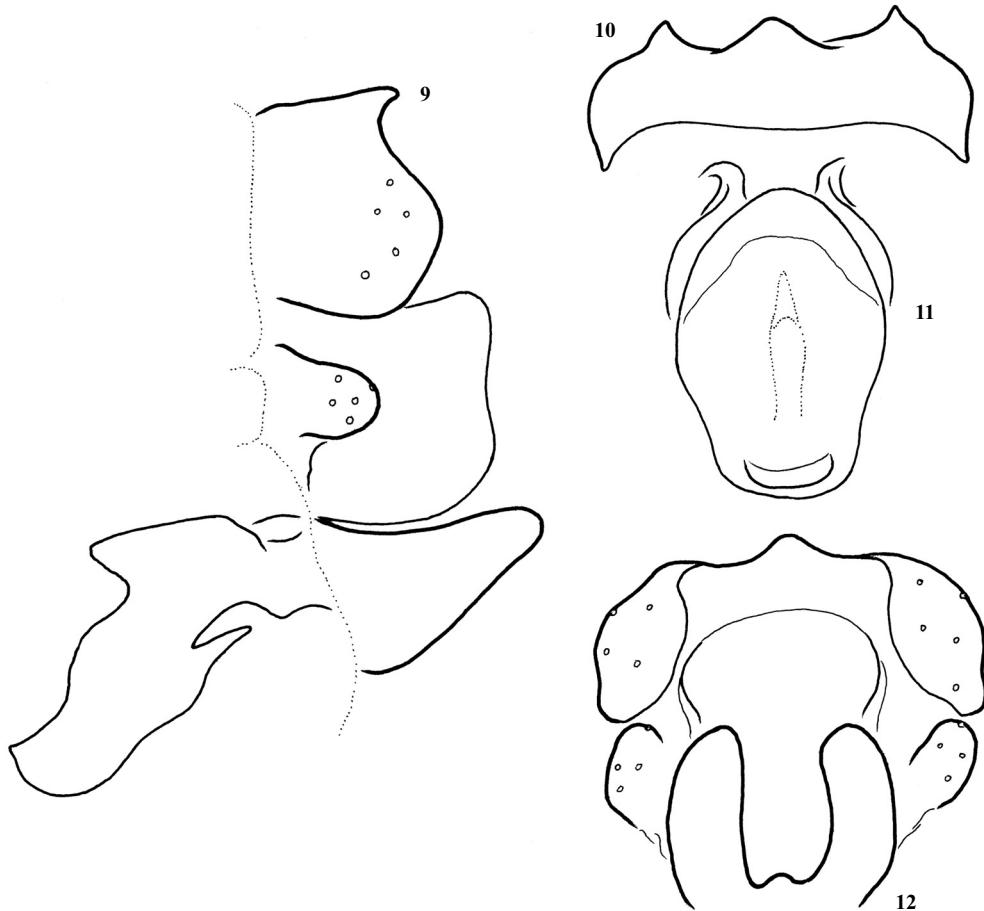

**Figs 4–8.** *Drusus gombos* Oláh sp. n. male holotype: 4 = male genitalia in lateral view; 5 = left paramere in lateral view, 6 = paraproct in dorsal view, 7 = posterodorsal black spinate area on tergite VIII in dorsal view, 8 = paraproct complex in caudal view

ventroapical corner; lateral profile of the paraproct different, and the female has trilobed, not bilobed, apical margin on the anal tube in dorsal view; the median lobe on the vulvar scale present, not absent; the dorsal profile of the vaginal sclerite complex different.

*Description* – Male (in alcohol). Dark castanean brown species; cephalic and thoracic sclerites dark, almost black, especially on the dorsum; cephalic and thoracic setose warts brown; appendages including legs, except coxa and proximal portion of femur, lighter brown, haustellum and intersegmental membranous teguments light. Spurs of male 1.3.3. Forewing length 12 mm.

Male genitalia (Figs 4–8). Posterodorsal black spinate area on tergite VIII slightly extended posteriorly, bilobed in dorsal view forming mesal concavity. Segment IX longer ventrally, very short bridle-like dorsally; its lateral elongated by rounded triangular lobe anteriad; midlateral sclerotized strips of sternite IX not pronounced; vestige of sternal lateral suture of the fused segment IX well developed. Segment X appearing as the basement of paraproct and cerci. Cerci are quadrangular with obliquely truncate apex in lateral view. Paraproctal complex together with its basement representing segment X forming a semi closed structure around the anal opening with ventrolateral triangular corners and the elaborated dorsal arms. Gonopods are upward arching broad triangular large lobe. Both aedeagus and parameres are slender; parameres with a larger and three small just discernible spines.

**Figs 9–12.** *Drusus gombos* Oláh sp. n. female allotype:

9 = female genitalia with the vaginal sclerite complex in lateral view; 10 = female genitalia in dorsal view;  
11 = vaginal sclerite complex in dorsal view; 12 = female genitalia in ventral view

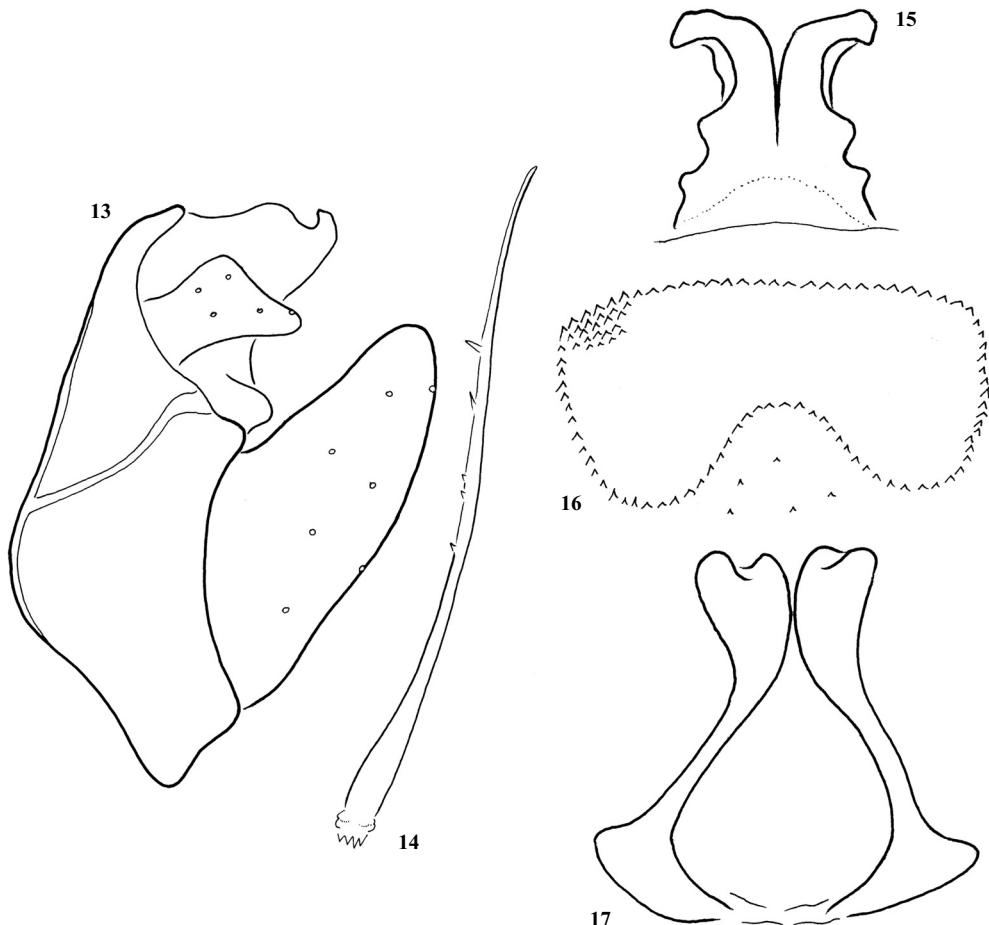

Female genitalia (Figs 9–12). Segment IX short tube open ventrally and embedded inside by membranous segment X encircling anus, its dorsum trilobed in dorsal view. Lateral setose lobe, the sternite of segment IX rounded. Supragenital plate of sternum X well-developed and quadrangular in lateral view. Median lobe of the vulvar scale (lower vaginal lip) very small, but present. Vaginal chamber medium sized reaching almost to the anterior margin of sternite VIII, vaginal sclerite complex oviform in dorsal view.

*Type material* – Holotype. Montenegro, Žabljak municipality, Sinjajevina Mts, Dobrilovina, forest stream at the monastery, N43°01.652', E19°24.086', 765 m, 25.05.2013, JP-KT-MG-PG (1♂, OPC). Allotype. Same as holotype (1♀, OPC). Paratypes. Same as holotype (2♀, OPC).

*Etymology* – *gombos*, from “gombos” (= button-like) in Hungarian, referring to the rounded knob-shaped dorsoapical lateral processes of the paraproct.

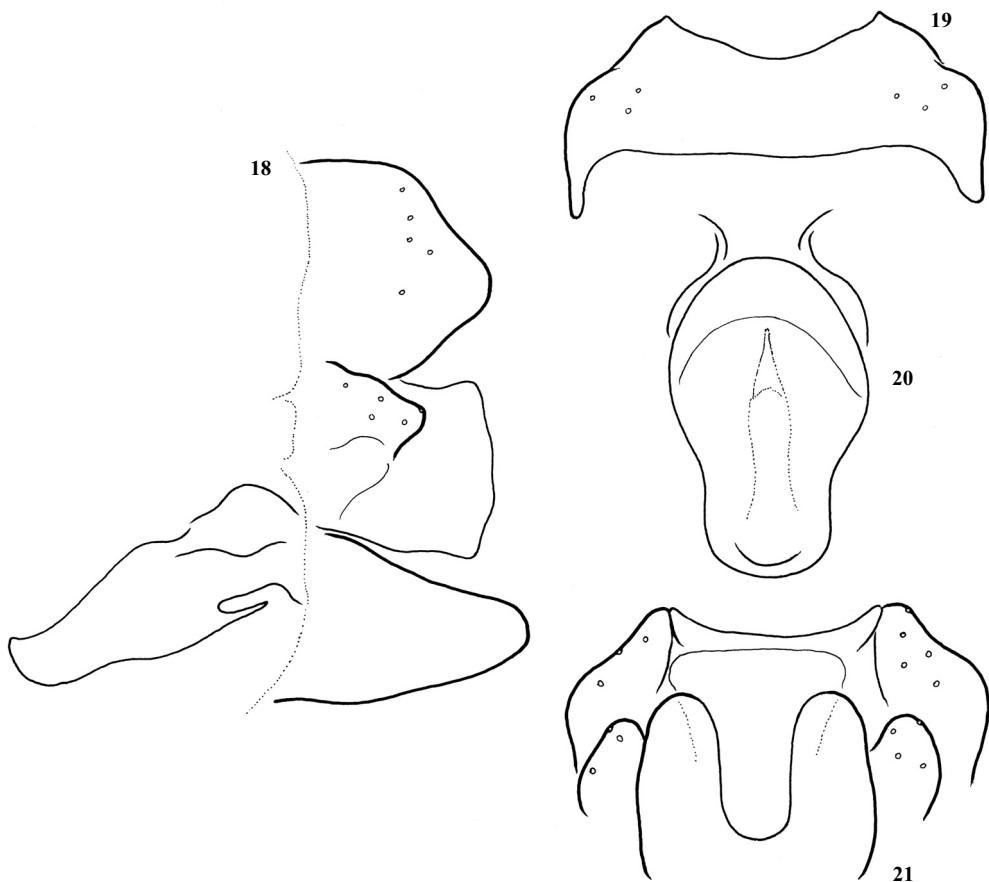

***Drusus klapaleki* Marinković-Gospodnetić, 1970 (Figs 13–21)**

The female of this species is unknown. We have collected a single female from a spring area together with three males. Here we describe the female and redraw the male in order to compare it with its close relative, with *Drusus gombos* sp. n. Compared to male of *D. gombos*, *D. klapaleki* has more slender cerci, differently shaped paraproct having apicolateral lobes hook-shaped, and slightly different spine pattern of the paramere.

**Figs 13–17.** *Drusus klapaleki* Marinković-Gospodnetić, 1970 male: 13 = male genitalia in lateral view; 14 = left paramere in lateral view, 15 = paraproct in dorsal view, 16 = posterodorsal black spinate area on tergite VIII in dorsal view, 17 = paraproct complex in caudal view

*Description of female* (Figs 18–21) – Dark castanean brown. Forewing length 12 mm. Segment IX short tube open ventrally and embedded inside by membranous segment X encircling anus, its dorsum bilobed in dorsal view. Lateral setose lobe, the sternite of segment IX rounded triangular. Supragenital plate of sternum X well-developed and quadrangular in lateral view. Median lobe of the vulvar scale (lower vaginal lip) completely reduced. Vaginal chamber

### ***Potamophylax julianii* Kumanski, 1999 (Figs 22–25)**

Here we describe the unknown female of this sexually dimorphic species. We have collected three females associated with two males from the same habitat. Females are brachypterous, smaller sized similarly to other species of the *Potamophylax winneguthi* species group.

*Description of female* – Brachypterous, forewings only slightly reach over the abdomen. Forewing length 10 mm. Male forewing length is 19 mm. Strong erected setae with alveoli mostly on veins, few on the wing membrane. Thoracic sclerite brown, contrasting to the dark castanean scletites of the male thorax. Anal tube formed by the fusion of tergite IX and segment X short and almost closed. Vestigial suture separating tergite IX and segment X discernible delineating the more sclerotized setose basal part (tergite IX) and the more membranous apical part (segment X); segment X with dorsal and ventral lobes as visible both in lateral and ventral view; ventral lobe with a few setae; a pair well sclerotized setose lateral lobes present on segment X with a few elongated setae among the dense small setae. Setose sternite IX rounded in lateral view. Setaless, glabrous supragenital plate of segment X narrow in ventral view, compressed to various shape by the enlarged sternite IX; supragenital plate functions as the upper lip of the vulva. Vulvar scale (lower vulvar lip) composed of large rounded lateral and small, almost reduced mesal lobe. Vaginal sclerite pattern complex.

*Material examined* – **Bulgaria**, Kyustendil province, Osogovska planina, beech forest and open brook at Osogovo hut, 1625 m, N42°11.791', E22°37.409', 23.10.2013, KJ-MD-
