Szűcs, P. (2017): Bryophyte flora of the Botanic Garden of the University of Sopron (W Hungary). – *Studia bot. hung.* 48(1): 77–88.

Abstract: In the course of the research conducted between 2004 and 2008 at the Botanic Garden of the University of Sopron, altogether 78 bryophyte taxa (4 liverworts and 74 mosses) were identified. Some Hungarian Red List taxa were detected from the territory: *Aphanorrhegma patens*, *Brachythecium glareosum*, *Campylium polygamum*, *Cirriphyllum piliferum*, *C. tommasinii*, *Cladacamnum dendroides*, *Eurhynchium striatum*, *Orthotrichum obtusifolium*, *Pottia intermedia*, *Rhynchostegiella tenella*, *Rhynchostegium murale*, *Schistidium elegantulum*, and *Tortula papillosa*.

Key words: bryophyte diversity, Hungarian botanic gardens, red list status, semi-natural habitats

INTRODUCTION

The first significant wave of bryological research conducted in Hungarian botanic gardens was between 1933 and 1968 involving renowned researchers such as László Vajda, Ádám Boros, and József Igmándy. Ádám Boros made visits to Hungarian botanic gardens including Budapest (1933, 1935, 1941, 1942, 1943, 1951), Szarvas (1948, 1960), Vácrátót (1953, 1954), Szeged (1960), and Debrecen (1960) but he also surveyed gardens in neighbouring countries (Kolozsvár, 1941; Pozsony, 1968; Kassa, 1962) and reported sporadic data on the bryoflora of these gardens in his travel diary (BOROS 1915–1971). Majority of these data has never been published, however.

The first description of the bryoflora of the botanic gardens of Vácrátót (VAJDA 1954) and Szigliget (VAJDA 1968) is linked with the name of László Vajda. Bryofloristical data of the botanic garden of Sopron have been published first by József Igmándy (IGMÁNDY 1949).

After a short intermission between 1968 and 1992, the bryofloristical research on Hungarian botanic gardens ran up again. István Galambos (GALAMBOS 1992) published results on the bryoflora of the botanic garden of Zirc.

Several new works were published in succession on already investigated but mostly unexplored botanic gardens, arboreta, and one castle garden: Agostyán

(Tata) (Szűcs 2009), Zirc (Szűcs 2013), Eger (Szűcs and PÉNZESNÉ 2017), Martonvásár (NAGY *et al.* 2016), Soroksár (NÉMETH and PAPP 2016), Budapest (Buda Arboretum) (Kovács and RIGÓ 2016).

The present research introduces the bryophyte flora of the Botanic Garden of the University of Sopron, basing on the investigations conducted between 2004 and 2008. Results were also compared with the bryoflora diversity of other Hungarian botanic gardens.

MATERIAL AND METHODS

In order to characterise the conservation and indicator status of taxa the Hungarian Red List was used (PAPP *et al.* 2010). The nomenclature of bryophytes follows PAPP *et al.* (2010). In the case of *Hypnum cupressiforme* var. *lacunosum* HILL *et al.* (2006) was used.

Locality descriptions include data with the following order: habitat, GPS coordinates, date of collection. The identifiers of the quadrates, according to the Central European Flora Mapping System, were indicated in square brackets (KIRÁLY 2003).

Collected individuals are stored at the Cryptogamic Herbarium of the Department of Botany and Plant Physiology at the Eszterházy Károly University, Eger (EGR).

Study area

The Botanical Garden of the University of Sopron is located in Győr-Moson-Sopron County, in the territory of the local administrative unit of Sopron, in the eastern foothills of the Sopron Hills. The extension of the territory is 17 hectares (Fig. 1). From the phytogeographical point of view the Sopron Hills are situated in the border region of the Alpine (Alpicum) and the Pannonic (Pannonicum) floristic provinces. The mean annual temperature varies between 8–9 °C, and the annual precipitation is usually between 650–900 mm (KIRÁLY 2004, SZMORAD 2011). The soils of the botanical garden were developed on loess, marl, and marl-like sediments, and the soil texture is loam and clayey-loam. The average soil pH is slightly acidic in the territory (FOLCZ and BÖRCSÖK 2015).

The garden contains 2691 woody plant taxa, 3691 herbaceous taxa, and 171 mushroom species. Among the taxa there are 16 in situ and 135 ex situ protected plant species, as well as 2 protected mushroom species (Kocsó 2008, FOLCZ and BÖRCSÖK 2015).

Site details

Collection of the specimens was carried out in Győr-Moson-Sopron County, in the territory of the local administrative unit of Sopron. Each collection point belongs to 8365.1 quadrant.

1. Rockery, stone wall, mown lawn, and roadside, bare soil surface, 47.680033° N, 16.572674° E (04.02.2004, 25.06.2004, 26.06.2004, 27.06.2004, 24.09.2005, 12.04.2006, 24.09.2008)

12. Bare soil surface, anthropogenic habitat, 47.681097° N, 16.577539° E (20.01.2004, 04.02.2004, 25.06.2004, 26.06.2004, 27.06.2004, 24.09.2005, 12.04.2006)

RESULTS

Number of taxa, conservation status, indicator species

According to the present investigations 78 bryophytes were collected in the Botanic Garden of the University of Sopron, including 4 liverworts and 74 mosses. Besides the common and frequent taxa, mosses which are still not threatened, but need attention (LC-att) according to the Hungarian Bryophyte Red List, can be found (e.g. *Brachythecium albicans*, *Cirriphyllum tommasinii*, *Climacium dendroides*, *Lophocolea bidentata*, *Pottia intermedia*, *Rhynchostegium murale* and *Tortula papillosa*).

Near threatened species were as follows: *Aphanorrhegma patens*, *Brachythecium glareosum*, *Campylium polygamum*, *Cirriphyllum piliferum*, *Orthotrichum obtusifolium*, and *Rhynchostegiella tenella*.

Indicator species which by their mere presence denote the greater level of conservation value of the habitat, also occur in the garden like *Lophocolea bidentata*, *Campylium polygamum*, *Cirriphyllum piliferum*, *Cirriphyllum tommasinii*, *Orthotrichum cupulatum*, *Pottia intermedia*, and *Rhynchostegiella tenella*.

List of species

Numbers refer to sites listed above. The substrates given after a semicolon refer to all listed sites.

Hepaticae

Lophocolea bidentata (L.) Dumort. – 4; on shady soil
Marchantia polymorpha L. – 12; on artificial stone

Pellia endiviifolia (Dicks.) Dumort. – 5; on shady, wet soil

Radula complanata (L.) Dumort. – 8; bark of *Populus ×euramericana*

Musci

Amblystegium serpens (Hedw.) Schimp. – 1, 2: on bark of *Acer platanoides*, 3, 7:
on bark of *Aesculus hippocastanum*, 8: on bark of *Aesculus hippocastanum*;
on soil

Amblystegium tenax (Hedw.) C. E. O. Jensen – 5; on shaded, wet stone

Aphanorrhagma patens (Hedw.) Lindb. – 6; on shady, wet, clayey soil

Atrichum undulatum (Hedw.) P. Beauv. – 3; on soil

Barbula convoluta Hedw. – 1, 5, 6; on exposed soil

Barbula unguiculata Hedw. – 1, 2, 3, 5, 6, 8, 12; on exposed soil

Brachythecium albicans (Hedw.) Schimp. 1, 5, 6; on exposed soil

Brachythecium glareosum (Spruce) Schimp. – 5; on concrete and stone

Brachythecium rutabulum (Hedw.) Schimp. – 2, 3, 6, 7, 8, 9; on soil

Brachythecium salebrosum (F. Weber et D. Mohr) Schimp. – 1: on bark of *Betula pendula*, 8; on bark of *Aesculus hippocastanum*

Brachythecium velutinum (Hedw.) Schimp. – 1, 3, 7; on shady soil

Bryum argenteum Hedw. – 1, 5, 6, 12; on exposed soil

Bryum bicolor Dicks. – 1; on soil

Bryum caespiticium Hedw. – 1, 5, 12; on exposed soil

Bryum capillare Hedw. – 6, 7; on soil

Bryum moravicum Podp. – 5; on bark of *Robinia pseudoacacia*; 6; on bark of *Tilia tomentosa*

Calliergonella cuspidata (Hedw.) Loeske – 7, 8; on wet soil

Campylium calcareum Crundw. et Nyholm – 6; on shady limestone

Campylium chrysophyllum (Brid.) Lange – 9; on soil

Campylium polygamum (Schimp.) C. E. O. Jensen – 8; on wet soil

Ceratodon purpureus (Hedw.) Brid. – 1: on stone and exposed soil; 4, 5: on stone
and concrete, 12; on artificial stone

Cirriphyllum piliferum (Hedw.) Grout – 3, 7, 8; on soil

Cirriphyllum tommasinii (Boulay) Grout – 5; on shaded stone

Climaciumpendula (Hedw.) F. Weber et D. Mohr – 7, 8; on shaded soil

Cratoneuron filicinum (Hedw.) Spruce – 6; on soil

Dicranella heteromalla (Hedw.) Schimp. – 11; on soil

Dicranella varia (Hedw.) Schimp. – 8; on soil

Didymodon vinealis (Brid.) R. H. Zander – 9; on soil

Euryhynchium angustirete (Broth.) T. J. Kop. – 3; on soil

Euryhynchium hians (Hedw.) Sande Lac. – 2, 3, 4, 6, 7, 8, 9, 11; on soil

- Eurhynchium striatum* (Hedw.) Schimp. – 3; on soil
Fissidens bryoides Hedw. – 7; on soil
Fissidens taxifolius Hedw. – 7, 8, 9; on bare soil
Funaria hygrometrica Hedw. – 2, 12; on soil
Grimmia pulvinata (Hedw.) Sm. – 1; on stone, 5; on stone and concrete
Homalothecium lutescens (Hedw.) H. Rob. – 1, 9; on exposed soil
Homalothecium philippeanum (Spruce) Schimp. – 1; on limestone
Hylocomium splendens (Hedw.) Schimp. – 7; on shaded soil
Hypnum cupressiforme Hedw. – 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12; soil, stone, concrete, bark of trees
Hypnum cupressiforme var. *lacunosum* Brid. – 5; on exposed stone
Leskeia polycarpa Ehrh. ex Hedw. – 4, 5, 8; on bark of *Populus*
Orthotrichum affine Schrad. ex Brid. – 5, 8; on bark of *Populus*
Orthotrichum anomalum Hedw. – 1; on exposed limestone
Orthotrichum cupulatum Brid. – 5; on exposed stone
Orthotrichum diaphanum Schrad. ex Brid. – 6; on bark of *Tilia tomentosa*, stone; 8; on bark of *Populus*
Orthotrichum obtusifolium Brid. – 5; on bark of *Fraxinus angustifolia*
Orthotrichum stramineum Hornsch. ex Brid. – 5; on bark of *Fraxinus*; 10; on bark of *Acer pseudoplatanus*
Phascum cuspidatum Hedw. – 1, 2, 5; on bare soil
Physcomitrium pyriforme (Hedw.) Brid. – 5; on wet, shaded soil
Plagiomnium affine (Blandow) T. J. Kop. – 7, 8; on soil
Plagiomnium cuspidatum (Hedw.) T. J. Kop. – 3, 5, 8; on soil
Plagiomnium rostratum T. J. Kop. – 2, 4, 5, 8; on soil
Plagiomnium undulatum (Hedw.) T. J. Kop. – 3, 4, 5, 8, 9; on soil
Plagiothecium cavifolium (Brid.) Z. Iwats. – 5; on soil
Platygyrium repens (Brid.) Schimp. – 2, 7; on bark of *Quercus*
Pohlia melanodon (Brid.) A. J. Shaw – 8; on soil
Pottia intermedia (Turner) Fürnr. – 1; on soil
Pottia lanceolata (Hedw.) Müll. Hal. – 1; on wet, shady soil
Pseudocrossidium hornschuchianum (Schultz) R. H. Zander – 1; on limestone
Pylaisia polyantha (Hedw.) Schimp. – 5; on bark of *Fraxinus*, 6; on bark of *Tilia tomentosa*
Rhynchosstegiella tenella (Dicks.) Limpr. – 5; on shaded, wet stone
Rhynchosstegium murale (Hedw.) Schimp. – 5; on concrete
Rhytidiodelphus squarrosus (Hedw.) Warnst. – 7; on soil
Rhytidiodelphus triquetrus (Hedw.) Warnst. – 7, 8; on soil
Schistidium crassipilum H. H. Blom – 6; on muscovite stone (ERZBERGER and SCHRÖDER 2008)

Schistidium elegantulum H. H. Blom – 9; on concrete (ERZBERGER and SCHRÖDER 2008)

Scleropodium purum (Hedw.) Limpr. – 3, 4, 7, 8; on soil

Thuidium abietinum (Hedw.) Schimp. – 8, 9; on soil

Thuidium delicatulum (Hedw.) Schimp. – 7, 8; on soil

Thuidium philibertii Limpr. – 7, 8; on soil

Thuidium tamariscinum (Hedw.) Schimp. – 7; on soil

Tortula muralis L. ex Hedw. – 1, 5, 6; on stone, 2, 3; on bitumen

Tortula papillosa Wilson – 5; on bark of *Fraxinus*

Tortula ruralis (Hedw.) P. Gaertn., B. Mey. et Scherb. – 1: on soil and stone; 5; on stone

DISCUSSION

Some common bryophytes of the botanic garden of Sopron, including *Amblystegium serpens*, *Barbula unguiculata*, *Brachythecium rutabulum*, *B. salebrosum*, *Eurhynchium hians*, *Bryum argenteum*, *Ceratodon purpureus*, *Hypnum cupressiforme*, *Leskeia polycarpa*, *Orthotrichum anomalum*, *O. diaphanum*, *Radula complanata*, *Tortula muralis*, and *Tortula ruralis* occur also in almost all investigated Hungarian botanic gardens and arboretums (Table 1). 62.8% of the species identified in the Botanic Garden of the University of Sopron can also be found in the Botanic Garden of Vácrátót. The results for other gardens and arboretums are as follows: Agostyán 40.0%, Eger 34.6%, Budapest 39.7%, Martonvásár 48.7%, Soroksár 50.5%, Szigliget 37.2%, and Zirc 52.6%.

Some less common mosses (*Amblystegium tenax*, *Fissidens bryoides*, *Rhynchosstegiella tenella*) were detected only in Sopron. The values show that the bryophyte flora of the Botanic Garden of the University of Sopron closely resembles the flora of some other investigated gardens (Zirc, Martonvásár, Soroksár) and the arboretum of Vácrátót, despite the long distance of the latter from Sopron. The high similarity can primarily be explained by the high number of species and the presence of common and frequent bryophytes.

The differences of the bryophyte flora of various gardens can mainly be explained by different habitats and natural conditions, various dimensions, different ages and level of bryophyte investigations (Fig. 2, Table 1).

The low proportion of liverworts (Fig. 2) in the investigated area is similar to the majority of other Hungarian botanic gardens and arboretums. However, this phenomenon is also very characteristic for many European cities and settlements (Szűcs *et al.* 2017).

Table 1. Occurrence of species in the Sopron Botanic Garden, in other Hungarian botanic gardens, arboretums and manor parks and percentage of similarity of bryophyte flora with that of Sopron Botanic Garden. Comparative data were obtained from the following sources: Agostyán (SZÜCS 2009), Eger (SZÜCS and PÉNZESNÉ-KÓNYA 2017), Budapest (KOVÁCS and RIGÓ 2016), Martonvásár (NAGY *et al.* 2016), Soroksár (NÉMETH and PAPP 2016), Szigliget (VAJDA 1968), Vácrátót (VAJDA 1954), Zirc (GALAMBOS 1992, SZÜCS 2013).

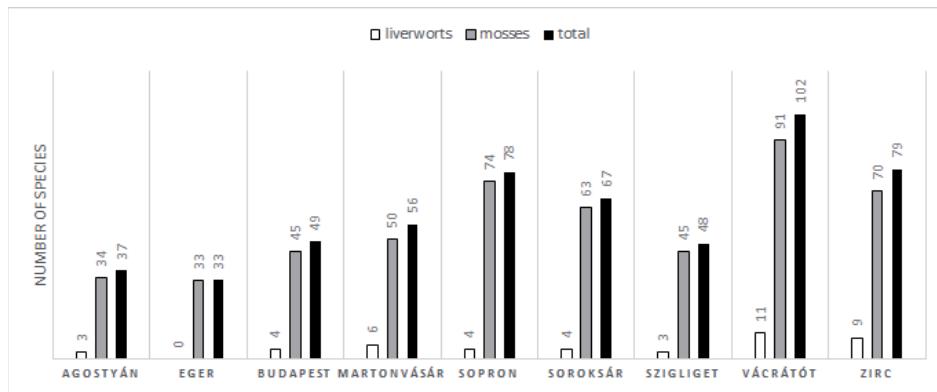

Fig. 2. The number of species of Hungarian botanic gardens, arboretums, and manor parks. Comparative data were obtained from the following sources: Agostyán (Szűcs 2009), Eger (Szűcs and PÉNZESNÉ-KÓNYA 2017), Budapest (KOVÁCS and RIGÓ 2016), Martonvásár (NAGY *et al.* 2016), Sopron (this work), Soroksár (NÉMETH and PAPP 2016), Szigliget (VAJDA 1968), Vácrátót (VAJDA 1954), Zirc (GALAMBOS 1992, SZŰCS 2013).

Acknowledgement – The author would like to express his gratitude to Peter Erzberger for his help in sample analysis. This research was supported by the grant EFOP-3.6.1-16-2016-00001 (“Complex improvement of research capacities and services at Eszterházy Károly University”).

Összefoglaló: A 2004. és 2008. között végzett kutatás alapján a Sopron Egyetem Botanikus Kertjének területéről összesen 78 mohafaj ismert, melyből 4 a májmohákhoz 74 pedig a lombos-mohákhoz tartozik. Figyelemre méltó mohafajok a hazai vörös lista alapján: *Aphanorrhegma patens*, *Brachythecium glareosum*, *Campylium polygamum*, *Cirriphyllum piliferum*, *Cirriphyllum tommasinii*, *Climacium dendroides*, *Euryhynchium striatum*, *Orthotrichum obtusifolium*, *Pottia intermedia*, *Rhynchostegiella tenella*, *Rhynchostegium murale*, *Schistidium elegantulum* és *Tortula papillosa*.
